RFID Event Management Services.

Module 3 of 10

Access Control (Perimeter and Restricted Areas) This is an area where one can get bogged down explaining all of the benefits RFID can bring to Access Control so keeping it simple:- once visitors or staff have been issued an RFID Card or Wristband they can proceed to the entrance where they can be scanned by and attended services or autonomously.

The scanner checks the RFID chip's credentials over the local network with the central database. Any permissions assigned to each individual are then shown on the scanner.

Once on site areas of the event may be restricted - the same process occurs to ensure only those permitted access can do so.

BUT - say an individual or group are granted (or denied) access to a particular area, the changes take place on the database so that when the RFID Chips are scanned the changes to the permissions are reflected on the scanner. A quick radio or phone call to event control can permit changes to permissions in seconds.

This makes managing and operating the event much easier and safer, provides historic data for analysis to improve future events, and once established, permits implementation of any of the other modules once the local network is established. A short video demonstrating the RFID Access Control Service.

Our Products and Services are competitively priced backed by a friendly, competent and experienced team ready to guide and support our Client's requirements.
